

Thoroughly tested in a full-size wind tunnel at MIRA in the UK

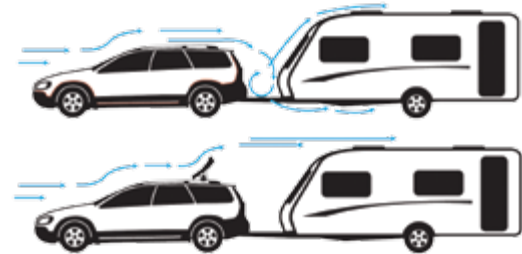

Improve not only your towing stability but your fuel economy with the Aeroplus wind deflector

Imagine a device that could vastly improve your fuel economy, all the while making your van safer and more stable to tow. The Aeroplus wind deflector from Purple Line is just such a product. A universally fitting, simple-to-install and lightweight roof mount, this is a true revolution in caravan safety devices.

Aeroplus has been developed over the course of 10 years, including extensive testing at the UK's Motor Industry Research Association (MIRA), and fur-

ther tests on Australia roads under our unique conditions. The wind deflector is proven to reduce drag and improve stability, from research conducted at both MIRA and the University of Johannesburg, South Africa. In controlled tests, Aeroplus has been shown to achieve a 15% fuel saving.

The concept behind Aeroplus is simple. Under normal circumstances when towing, wind is directed into the gap between your tow vehicle and caravan, increasing air resistance and forcing the vehicle to use more power (and fuel) to tow. With Aeroplus installed, aerodynamic curves on the streamlined design direct wind over and above the roof of your caravan. The van is now caught in the slipstream of your tow vehicle, avoiding much of the usual air

turbulence and boosting the stability and safety of your van, especially on motorways.

Fitting to almost any tow vehicle by way of roof bars, the Aeroplus wind deflector is an easy-to-install device that even the most novice handyman can secure and remove as travel requirements dictate. This is a device bound to improve your next adventure, from the safety of your rig to an always-welcome improvement in fuel economy. ■
